Appendix 12.1: Construction Dust Risk Assessment Tables

Table A.12.1: Determination of Dust Raising Magnitude

Source	High	Medium	Low
Demolition	Total building volume >75,000m ³ , potentially dusty construction material (e.g. concrete), on site crushing and screening, demolition activities >12m above ground	Total building volume 12,000 m ³ – 75,000 m ³ , potentially dusty construction material, demolition activities 6-12 m above ground level	Total building volume <12,000 m ³ , construction material with low potential for dust release (e.g. metal cladding or timber), demolition activities <6 m above ground, demolition during wetter months
Earthworks	Total site area >110,000 m ² , potentially dusty soil type (e.g. clay, which will be prone to suspension when dry due to small particle size), >10 heavy earth moving vehicles active at any one time, formation of bunds >6 m in height	Total site area 18,000 m ² – 110,000 m ² , moderately dusty soil type (e.g. silt), 5-10 heavy earth moving vehicles active at any one time, formation of bunds 3m - 6m in height	Total site area <18,000 m ² , soil type with large grain size (e.g. sand), <5 heavy earth moving vehicles active at any one time, formation of bunds <3 m in height
Construction	Total building volume >75,000 m ³ , on site concrete batching, sandblasting	Total building volume 12,000 m ³ – 75,000 m ³ , potentially dusty construction material (e.g. concrete), on site concrete batching	Total building volume <12,000 m ³ , construction material with low potential for dust release (e.g. metal cladding or timber)
Track out	>50 HDV (>3.5t) trips in any one day, potentially dusty surface material (e.g. high clay content), unpaved road length >100m	20-50 HDV (>3.5t) outward movements in any one day, 10 moderately dusty surface material (e.g. high clay content), unpaved road length 50 m – 100 m	<20 HDV (>3.5t) outward movements in any one day, surface material with low potential for dust release, unpaved road length <50 m

¹ Institute of Air Quality Management (2024) Guidance on the assessment of dust from demolition and construction

Table A.12.2: Receptor Sensitivity

Source	High	Medium	Low
Sensitivities of people to dust soiling effects	<ul style="list-style-type: none"> Users can reasonably expect (See note A) an enjoyment of a high level of amenity; or The appearance, aesthetics or value of their property would be diminished by soiling; and The people or property would reasonably be expected to be present continuously, or at least regularly for extended periods, as part of the normal pattern of use of the land. Indicative examples include dwellings, museums and other culturally important collections, medium and long term car parks (See note B) and car showrooms. 	<ul style="list-style-type: none"> Users would expect (See note A) to enjoy a reasonable level of amenity, but would not reasonably expect (See note A) to enjoy the same level of amenity as in their home; or The appearance, aesthetics or value of their property could be diminished by soiling; or The people or property wouldn't reasonably be expected to be present here continuously or regularly for extended periods as part of the normal pattern of use of the land. Indicative examples include parks and places of work. 	<ul style="list-style-type: none"> The enjoyment of amenity would not reasonably be expected (See note A); or Property would not reasonably be expected to be diminished in appearance, aesthetics or value by soiling; or There is transient exposure, where the people or Property would reasonably be expected to be present only for limited periods of time as part of the normal pattern of use of the land. Indicative examples include playing fields, farmland (unless commercially-sensitive horticultural), footpaths, short term car parks (See note B) and roads.
Sensitivities of people to the health effects of PM ₁₀	<ul style="list-style-type: none"> Locations where members of the public are exposed over a time period relevant to the air quality objective for PM₁₀ (in the case of the 24-hour objectives, a relevant location would be one where individuals may be exposed for eight hours or more in a day - See note C). Indicative examples include residential properties. Hospitals, schools and residential care homes should also be considered as having equal sensitivity to residential areas for the purposes of this assessment. 	<ul style="list-style-type: none"> Locations where the people exposed are workers (See note D), and exposure is over a time period relevant to the air quality objective for PM₁₀ (in the case of the 24-hour objectives, a relevant location would be one where individuals may be exposed for eight hours or more in a day). Indicative examples include office and shop workers, but will generally not include workers occupationally exposed to PM₁₀, as protection is covered by Health and Safety at Work legislation. 	<ul style="list-style-type: none"> Locations where human exposure is transient (See note E). Indicative examples include public footpaths, playing fields, parks and shopping streets.
Sensitivities of receptors to ecological effects (See note F)	<ul style="list-style-type: none"> Locations with an international or national designation and the designated features may be affected by dust soiling; or Locations where there is a community of a particularly dust sensitive species such as vascular species included in the Red Data List For Great Britain (See note G). 	<ul style="list-style-type: none"> Locations where there is a particularly important plant species, where its dust sensitivity is uncertain or unknown; or Locations with a national designation where the features may be affected by dust deposition Indicative example is a Site of Special Scientific Interest (SSSI) with dust sensitive features. 	<ul style="list-style-type: none"> Locations with a local designation where the features may be affected by dust deposition. Indicative example is a local Nature Reserve with dust sensitive features.

Source	High	Medium	Low
Sensitivities of receptors to ecological effects (See note F) (Continued)	<ul style="list-style-type: none">Indicative examples include a Special Area of Conservation (SAC) designated for acid heathlands or a local site designated for lichens adjacent to the demolition of a large site containing concrete (alkali) buildings.		

Source: IAQM (2024)

- A The public's expectations will vary depending on the existing dust deposition in the area.
- B Car parks can have a range of sensitivities depending on the duration and frequency that people would be expected to park their cars there, and the level of amenity they could reasonably expect whilst doing so. Car parks associated with work place or residential parking might have a high level of sensitivity compared to car parks used less frequently and for shorter durations, such as those associated with shopping. Cases should be examined on their own merits.
- C This follows DEFRA guidance as set out in LAQM.TG(22).
- D Notwithstanding the fact that the air quality objectives and limit values do not apply to people in the workplace, such people can be affected to exposure of PM₁₀. However, they are considered to be less sensitive than the general public as a whole because those most sensitive to the effects of air pollution, such as young children are not normally workers. For this reason workers have been included in the medium sensitivity category.
- E There are no standards that apply to short-term exposure, e.g. one or two hours, but there is still a risk of health effects, albeit less certain.
- F A Habitat Regulation Assessment of the Scheme may be required as part of the planning process, if the Scheme lies close to an internationally designated site i.e. SACs, Special Protection Areas (SPAs) designated under the Habitats Directive (92/43/EEC) and RAMSAR sites.
- G Cheffing C. M. & Farrell L. (Editors) (2005), The Vascular Plant. Red Data List for Great Britain, Joint Nature Conservation Committee.

Table A.12.3: Sensitivity of the Area to Dust Soiling Effects on People and Property (See note A and B)

Receptor Sensitivity	Number of Receptors	Distance from the source (m) (See note C)			
		<20	<50	<100	<250
High	>100	High	High	Medium	Low
	10-100	High	Medium	Low	Low
	1-10	Medium	Low	Low	Low
Medium	>1	Medium	Low	Low	Low
Low	>1	Low	Low	Low	Low

Source: IAQM (2024)

A The sensitivity of the area should be derived for each of the four activities: demolition, construction, earthworks and trackout.

B Estimate the total number of receptors within the stated distance. Only the highest level of area sensitivity from the table needs to be considered. For example, if there are 7 high sensitivity receptors <20m of the source and 95 high sensitivity receptors between 20 and 50m, then the total of number of receptors <50m is 102. The sensitivity of the area in this case would be high.

C For trackout, the distances should be measured from the side of the roads used by construction traffic.

Table A.12.4: Sensitivity of the Area to Human Health Effects (See note A and B)

Receptor Sensitivity	Annual Mean PM ₁₀ Concentration	Number of Receptors	Distance from source (m) (See note E)			
			<20	<50	<100	<250
High	>32 µg/m ³	>100	High	High	High	Medium
		10-100	High	High	Medium	Low
		1-10	High	Medium	Low	Low
	28-32 µg/m ³	>100	High	High	Medium	Low
		10-100	High	Medium	Low	Low
		1-10	High	Medium	Low	Low
	24-28 µg/m ³	>100	High	Medium	Low	Low
		10-100	High	Medium	Low	Low
		1-10	Medium	Low	Low	Low
Medium	<24µg/m ³	>100	Medium	Low	Low	Low
		10-100	Low	Low	Low	Low
	28-32 µg/m ³	>10	Low	Low	Low	Low
		1-10	Low	Low	Low	Low
	24-28 µg/m ³	>10	Low	Low	Low	Low
		1-10	Low	Low	Low	Low

Receptor Sensitivity	Annual Mean PM ₁₀ Concentration	Number of Receptors	Distance from source (m) (See note E)			
			<20	<50	<100	<250
Medium (continued)	<24µg/m ³	>10	Low	Low	Low	Low
		1-10	Low	Low	Low	Low
Low	-	>1	Low	Low	Low	Low

Source: IAQM (2024)

- A The sensitivity of the area should be derived for each of the four activities: demolition, construction, earthworks and trackout.
- B Estimate the total within the stated distance (e.g. the total within 250m and not the number between 100 and 250m), noting that only the highest level of area sensitivity from the table needs to be considered. For example, if there are 7 high sensitivity receptors <20 m of the source and 95 high sensitivity receptors between 20 and 50m, then the total of number of receptors <50m is 102. If the annual mean PM₁₀ concentration is 29µg/m³, the sensitivity of the area would be high.
- C Most straightforwardly taken from the national background maps but should also take account of local sources. The values are based on 32µg/m³ being the annual mean concentration at which an exceedance of the 24-hour objective is likely in England, Wales and Northern Ireland. In Scotland there is an annual mean objective of 18µg/m³.
- D In the case of high sensitivity receptors with high occupancy (such as schools or hospitals) approximate the number of people likely to be present. In the case of residential dwellings, just include the number of properties.
- E For trackout, the distances should be measured from the side of the roads used by construction traffic.

Table A.12.5: Sensitivity of the Area to Ecological Effects (See note A and B)

Receptor Sensitivity	Distance from the source (m) (See note C)	
	<20	<50
High	High	Medium
Medium	Medium	Low
Low	Low	Low

Source: IAQM (2024)

- A The sensitivity of the area should be derived for each of the four activities: demolition, construction, earthworks and trackout.
- B Only the highest level of area sensitivity from the table needs to be considered.
- C For trackout, the distances should be measured from the side of the roads used by construction traffic up to 250m from the site entrance..

Table A.12.6: Risk of Dust Effects - Demolition

Sensitivity of Area	Dust Emissions Magnitude		
	High	Medium	Low
High	Major Risk	Moderate Risk	Moderate Risk
Medium	Major Risk	Moderate Risk	Minor Risk
Low	Moderate Risk	Minor Risk	Negligible

Appendix 12.2: Model Verification

12.7.1 Overview

Model verification is a process by which checks are carried out to determine the performance of a dispersion model at a local level, primarily by comparison of modelled results with monitoring data. The verification process benefits an assessment by investigating uncertainties and minimising them either through informed refinement of model input parameters or adjustment of the model output if it is deemed necessary.

The Department for Environment Food and Rural Affairs (Defra) TG22 guidance provides a methodology for model verification, including calculation methods and directions on the suitability of monitoring data.

Verification of modelled 2018 annual mean NO₂ concentrations has been undertaken utilising monitoring results from relevant diffusion tube sites within the study area.

Background concentrations used in the model verification have been taken from Defra. The background maps for NOx, NO₂, PM₁₀ and PM_{2.5} concentrations are split into source sectors. Selected 'in-grid' road sector's were removed from the background concentration estimates using Defra's sector removal tool to avoid double counting of road traffic emissions in the modelling process.

The adjusted background concentrations used for the verification are presented in Table A.12.10 below.

Table A.12.10: Adjusted Defra background pollutant map data for verification

Grid Square	2018 background concentration ($\mu\text{g}/\text{m}^3$)	
	NOx	NO ₂
450_210	17.7	13.1
449_210	17.2	12.8

12.7.2 Air Quality Monitoring Data

Data from Oxford City Council (OCC) was reviewed to determine the suitability of each of the monitoring locations for inclusion in the model verification process. The criteria used to determine the suitability of the monitoring data for inclusion into the verification process were:

- The monitoring site was at a roadside or near a road location within the air quality study area.
- The exact location of the monitoring site could be accurately identified.
- Data capture was greater than 75% over the monitoring period.
- The monitoring site was not influenced by substantial road or other emission sources for which data was not available in the traffic reliability area, and therefore could not be included in the dispersion model.
- The monitoring site was not influenced by any factors considered to have the potential to have a substantial influence on the dispersion of emissions affecting that location, and which could not be accurately accounted for within the modelling process (e.g. elevated road sections or sections of road in cutting, or walls/barriers/dense vegetation between the monitoring site and the nearest road traffic emission source).
- The monitoring site was not affected by local emission sources (e.g. from a petrol station, bus station, car park or buses accelerating from a bus stop).

- The monitoring site was located in the vicinity of the study area.

For this reason, DT83 (not explicitly visible in StreetView and is likely behind dense vegetation) and TF26 (<75% data capture) have been excluded from the model verification:

In total, three OCC monitoring sites were used for verification. The exact location of each of the sites selected has been confirmed using street photography. Table A.12.11 presents the monitoring data used within the model verification.

Table A.12.11: Monitoring data used within model verification

Site ID	OS Grid Reference		2018 Annual Mean NO ₂ (µg/m ³)
	X	Y	
DT25	450419	210258	25.0
DT26	450389	210189	32.0
DT71	449612	210213	27.0

There were no PM₁₀ or PM_{2.5} analysers within the study area to enable model verification. Therefore, the NO_x adjustment factors have been applied to modelled road PM₁₀ and PM_{2.5} contributions, following guidance in Defra TG22.

12.7.3 Results

Table A.12.12 presents a comparison of the monitored and modelled concentrations of NOx and NO₂ at the diffusion tube sites for the year 2018. There is a systematic underprediction of NO₂ concentrations at D26 and D71 (-10.2% and -8.9%, respectively), whereas site DT25 there is an overprediction of 4.2%.

Table A.12.12: Unadjusted model verification results

Site ID	Monitored road NOx (µg/m ³)	Modelled road NOx (µg/m ³)	Monitored total NO ₂ (µg/m ³)	Modelled total NO ₂ (µg/m ³)	Total NO ₂ difference (%)
DT25	23.0	25.1	25.0	26.1	4.2
DT26	37.6	30.7	32.0	28.7	-10.2
DT71	27.6	22.7	27.0	24.6	-8.9

Table A.12.12 and Figure A 12.1 present a comparison of the monitored and modelled concentrations of NO_x and NO₂ at the verification sites. Following Defra guidance, modelled and measured road traffic concentrations have been compared to derive a verification factor to apply to the modelled results. As diffusion tubes only measure total NO₂, the road traffic NO_x concentration measured by the diffusion tube was estimated following Defra TG22. Monitored road traffic NO_x was estimated using Version 8.1 of the NO_x to NO₂ calculator, based on the Defra predicted background NO₂.

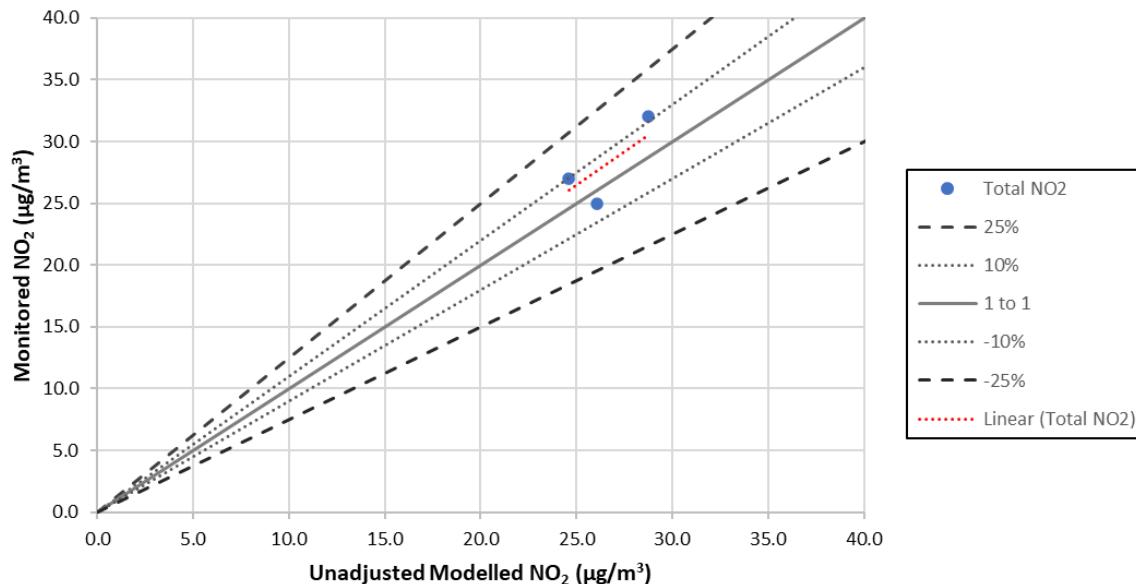

Figure A 12.1: Unadjusted model verification (annual mean NO₂; µg/m³)

Following Defra guidance, a model adjustment factor of 1.13 has been calculated when comparing modelled and monitored road traffic NO_x.

Table A.12.13 and Figure A 12.2 present the adjusted modelled NO₂ with monitored NO₂ at the verification sites. The model predicts NO₂ concentrations within 10% of the monitored concentrations at two sites and predicts NO₂ concentrations within 25% of the monitored concentrations at all sites. The model is therefore performing adequately at these locations following adjustment.

Table A.12.13: Adjusted model verification results

Site ID	Monitored total NO ₂ (µg/m ³)	Adjusted modelled total NO ₂ (µg/m ³)	Total NO ₂ difference (%)
DT25	25.0	27.6	10.5
DT26	32.0	30.6	-4.3
DT71	27.0	26.0	-3.6

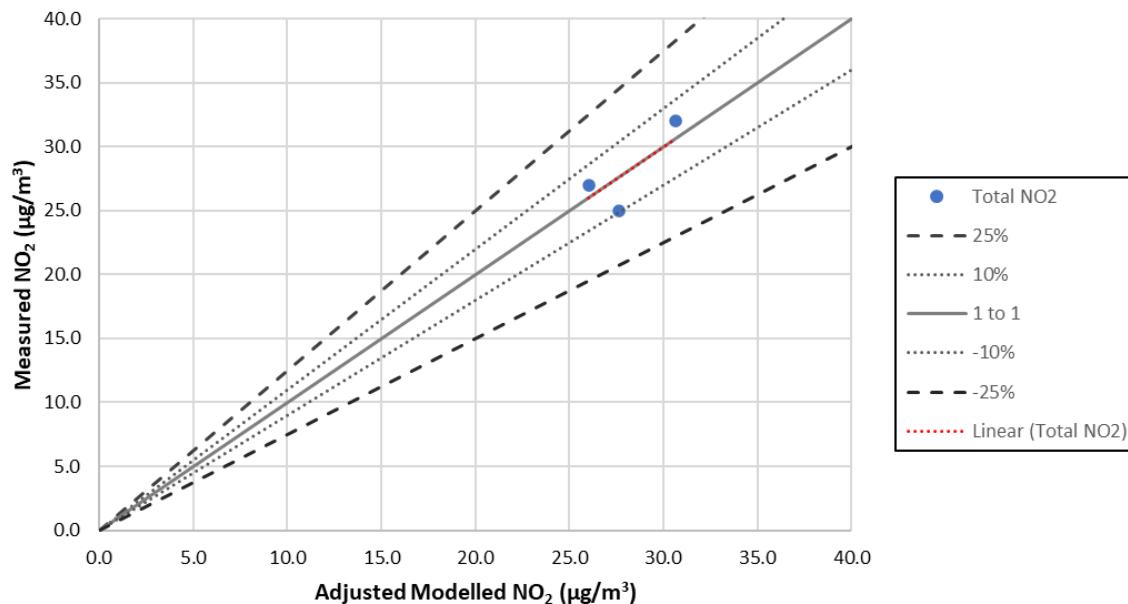

Figure A 12.2: Adjusted model verification (annual mean NO₂; µg/m³)

Table A.12.14 presents statistical parameters for describing model uncertainty. The Root Mean Square Error (RMSE) is used to define the average error or uncertainty of the model. The results of the RMSE calculation in this case are concentrations of NO₂ measured in units of micrograms per metre cubed. Table A.12.14 shows that before adjustment, the model uncertainty was ±2.42 µg/m³ or 6.0% of the annual mean NO₂ objective. After adjustment, the model uncertainty is reduced to ±1.80 µg/m³ or 4.5% of the annual mean NO₂ objective. Therefore, the model uncertainty is well within the desired 10% of the relevant objective, as recommended by Defra guidance.

Fractional Bias (FB) is used to identify if the model shows a tendency to over or under predict and values can vary between +2 and -2 and have an ideal value of 0. Negative values suggest a model over-prediction and positive values suggest a model under-prediction. Table A.12.14 shows that, before adjustment, the model is under-predicting annual mean NO₂ concentrations. Following adjustment, the model is at the desired FB value of 0.

The correlation coefficient (R) is used to measure the linear relationship between modelled and measured data. A value of zero means no relationship and a value of 1 means absolute relationship. Following model adjustment, the value of R marginally increases from 0.80 to 0.81.

Table A.12.14: Description of model uncertainty

Statistical parameter	Before adjustment	After adjustment	Ideal value
Root mean square error	2.42	1.80	0
Fractional bias	0.06	0	0
Correlation coefficient	0.80	0.81	1

The statistical analysis above demonstrates that the model performs adequately versus monitoring data, following adjustment. An adjustment factor of 1.13 has therefore been applied to modelled road NO_x, PM₁₀ and PM_{2.5} contributions at all receptors.

Source: Ridge and Partners LLP

Note: (a) roundabout calculated based on the sum of all entry roads to the roundabout divided by two (assuming most road users use half the roundabout).

(b) additional roundabout modelled in the operational scenario due differences in the affected road network (ARN).

Appendix 12.7: Sensitivity Test

12.7.1 Overview

Traffic data, derived from 2023 survey counts, has been made available for this assessment. As no local authority 2023 monitoring data is currently available at time of writing, no reassessment of model verification was possible to account for this new traffic data. The 2018 adjustment factor of 1.13 has therefore been applied to modelled road NO_x, PM₁₀ and PM_{2.5} contributions at all receptors. As a conservative approach, an additional sensitivity test has been undertaken using a proxy verification factor of 1.5 to account for any potential rise in factor. Results of which are presented in this Appendix.

Table A 12.21 and Table A 12.22 present revised results with the 1.5 proxy verification factor for the construction and operational results respectively. Overall, the conclusions remain unchanged from the results presented within the main assessment.

Table A.12.21: Summary of Annual Mean NO₂ Predicted Pollutant Concentration (Including Backgrounds) and Significance During Construction with Proxi Factor

Receptor ID	Description	NO ₂ Concentration ($\mu\text{g}/\text{m}^3$)		Change in concentration as a percentage of AQAL (%)	Significance
		DM 2025	DS 2025		
Ox_Con_1(a)	Stratfield Brake Sports Ground	-	11.4	-	-
Ox_Con_2	Residential property on Frieze Way	17.0	17.1	<0.1	Negligible
Ox_Con_3	Trax Education Centre, Red Barn Farm Cottage	15.5	15.5	<0.1	Negligible
Ox_Con_4	Residential property at Collett Drive	13.9	13.9	<0.1	Negligible
Ox_Con_5	Residential property at A44 Woodstock Road	21.2	21.3	<0.1	Negligible

Table A.12.22: Summary of Annual Mean NO₂ Predicted Pollutant Concentration (Including Backgrounds) and Significance During Operation with Proxi Factor

Receptor ID	Description	NO ₂ Concentration ($\mu\text{g}/\text{m}^3$)			Significance
		DM 2026	DS 2026	Change in concentration as a percentage of AQAL (%)	
Ox_Op_1	Residential property at A4260 Oxford Rd	12.0	12.1	0.2	Negligible
Ox_Op_2 ^(a)	Stratfield Brake Sports Ground	-	11.1	-	-
Ox_Op_3	Residential property at Oxford Rd	17.8	18.0	0.6	Negligible

Receptor ID	Description	NO ₂ Concentration ($\mu\text{g}/\text{m}^3$)			Significance
		DM 2026	DS 2026	Change in concentration as a percentage of AQAL (%)	
Ox_Op_4	Trax Education Centre, Red Barn Farm Cottage	15.0	15.0	<0.1	Negligible
Ox_Op_5	Residential property at 566 Banbury Road	20.1	20.4	0.8	Negligible
Ox_Op_6 ^(a)	Oxford Hawks Hockey Club	-	11.9	-	-
Ox_Op_7	Committed development - Oxford North	14.0	14.0	<0.1	Negligible
Ox_Op_8	Residential property at 369A Woodstock Road	19.4	19.5	0.2	Negligible
Ox_Op_9	Residential property on Sunderland Ave	19.6	19.7	0.2	Negligible
Ox_Op_10	Residential property at 31 David Walter Cl	15.3	15.4	<0.1	Negligible
Ox_Op_11	Residential property at 11 Wyatt Road	14.3	14.3	<0.1	Negligible
Ox_Op_12	Residential property at 44 Collett Drive	13.7	13.7	<0.1	Negligible

Table A.12.23 highlights that the changes in nitrogen deposition with ammonia are less than 0.4 kg N/ha/yr at all ecological receptors and are concluded to be of no significant impacts at all modelled ecological receptors during construction, even with the higher proxy verification factor.

Table A.12.24 highlights the changes in nitrogen deposition with ammonia are less than 0.4 kg N/ha/yr at all designated habitats, with the exception of four modelling points at Stratfield Brake LWS transect 1 & transect 2 during operation. It is noted that even in the DM Scenario, the site already exceeds the lower critical load and the change is small in comparison. In accordance with DMRB LA 105 (see Section 12.99 of Chapter 12), this change of greater than 0.4 kg N/ha/yr predicted at these two locations, has been reviewed by the Competent expert for Biodiversity and it is concluded to be not significant. See Chapter 8 for further discussion.

Table A.12.25 highlights that ecological designated sites adjacent to the A34 are 'above standard'; however, the overall change is small and therefore not significant. The largest change in NO_x concentrations is at the Stratfield Brake LWS transects, which exceeds a change greater than 0.4 $\mu\text{g}/\text{m}^3$ however this site is 'within standard' and is therefore not significant, even with the higher proxy verification factor.

Table A.12.26 highlights that ecological designated sites adjacent to the A34 are 'above standard'; however, the overall change is small and therefore not significant. The largest change in NO_x concentrations is at the Stratfield Brake LWS transects, which exceeds a change greater than 0.4 $\mu\text{g}/\text{m}^3$ however this site is 'within standard' and is therefore not significant, even with the higher proxy verification factor.

Overall, the conclusions remain unchanged from the results presented within the main assessment.

Table A.12.23: Summary of worst case ecological receptors during construction (2025), nitrogen deposition with ammonia emissions with proxy verification factor

Designated site name	Receptor ID with greatest change in N deposition	Lower critical load (CL) (kg N/ha/yr)	Average background N deposition (kg N/ha/yr)	DM 2025 total N deposition (kg N/ha/yr)	DS 2025 total N deposition (kg N/ha/yr)	Change in N deposition (DS-DM) (kg N/ha/yr)	Potentially Significant
