

Supporting information relating to the installation of solar panels at The Long House OX15 5RG

The installation proposed will be of nine panels each 2m X 1m in three rows of three. The panels will be ground mounted and will be approximately 1m high and each row will be 6m long and 1m apart. They will not be visible from the public highway as the existing hedging to the N boundary is substantial and furthermore the installation is in an elevated position above Main St as is the majority of the site of The Long House and The Small House. The purpose of the installation together with a proposed battery installation (positioned within the curtilage of the Long House and not visible) is to substantially reduce the amount of electricity (particularly at peak times) needed to be drawn from the grid and to reduce further the carbon footprint of The Long House.
