## Land North East of Oxford Road West of Oxford Canal and East Of Bankside, Banbury, Oxfordshire

# *Technical Note: Response to Oxfordshire County Council's (Drainage) Comments* dated 12<sup>th</sup> May 2020 for Application 19/01047/OUT-2

22<sup>nd</sup> May 2020

### **1** Introduction

This technical note responds to the latest comments provided by Drainage Engineer Adam Littler by email on the 12<sup>th</sup> May 2020, acting on behalf of Oxfordshire County Council (OCC) Lead Local Flood Authority.

The comments relate to the submission of the Flood Risk Assessment (*10327 FRA02 Rv4*) produced by Brookbanks Consulting Ltd (BCL), in support of the outline application at Land North East of Oxford Road West of Oxford Canal and East Of Bankside, Banbury, Oxfordshire. They are for the majority the same comments are raised by the LLFA in their note dated 29<sup>th</sup> July 2019 with several additional queries within the email itself.

For this note, the comments are dealt with in order, being the original response document of the 29<sup>th</sup> July 2019 and then further comments within the email dated 12<sup>th</sup> May 2020. A revised drainage plan has been produced (10327 DR05 Rev F) which is located within Appendix A of this note.

The application comprises the following:

- Up to 825 residential units,
- Area designated for allotments and green space.

NCC's commentary is noted in *italics* and BCL's response is noted in blue.

### 2 OCC Drainage Response Note dated 29<sup>th</sup> July 2019

1. Confirmation required that the site surface water management proposal is based on full infiltration techniques.

All surface water from the site is proposed to be discharged via the infiltration basin in the north of the site. No storm water has been designed to discharge into watercourses, drainage ditches or existing surface water sewers. The rate of infiltration from the basin is 9.06 x10<sup>-5</sup>. This is indicated on the drainage strategy DR-05 Rev E within Appendix B of the submitted FRA and its revision to F included in Appendix A of this note. It is also within Figure 4d of the FRA. In addition full infiltration testing has been carried out on the site to BRE digest requirements and results included in the FRA. Included as Appendix B in this note is a plan illustrating the location of all that testing for clarity.

2. Discharge at relevant return periods to be at Greenfield rate.

Storm Water from the site is to be completely infiltrated as discussed above and this forms the basis of the design as shown in the FRA; therefore, no surface water is proposed to be discharged from the site to any water courses. This is in line with the preferred drainage train of discharge, Infiltration being the preferred method in the first instance. Given that this is the case it is the infiltration rate that drives the design not the Greenfield runoff rate.

*3.* 40% Climate Change allowance to be applied to calculations.

40% climate change has been applied to the drainage calculations. This is shown on the Source Control calculation within the appendix of the FRA and within paragraphs 4.24 and 4.28 of Chapter 4.

4. MicroDrainage calculations provided use default Cv values, these are not representative of the site. It is recommended values of 0.95 for roofs and 0.9 for paved areas are applied. The designer must justify where a Cv of less than 0.9 has been used.

The default Cv values have not been used for this design. As outlined in your previous comments (19/01047/OUT, 26<sup>th</sup> July 2019) a value of 0.925 was then used within the basin design. As this is an outline application the masterplan has yet to be fixed, therefore, we have continued to use 0.925 Cv value as a compromise between the amount of roof and paved area that will be provided within the site. Microdrainage calculations for the detailed submission when exact roofing and paved areas are known can use specific Cv values.

5. Calculations should be undertaken for all relevant return periods and identify the critical duration used.

The calculations for the 1 in 1-year and 1 in 30-year return periods are included within Appendix B of this note.

The critical duration that has been used is the 1 in 100 year + 40% climate change, 120-minute storm event. This is indicated in red lettering on the Source Control calculations within the FRA.

6. Any phasing of the development needs to be demonstrated and how surface water will be managed during this process.

Phasing for the development will be determined at Reserved Matters. Currently the drainage plan (DR-05 Rev E) illustrates how each residential parcel will discharge its surface water into the basin which is located at the lowest point of the site. Many factors as well as drainage will determine phasing and the interim drainage for that must be completed at the appropriate time. i.e. RM or detailed application stage.

7. Explanation required as to whether the pond is proposed as Approach 1 or 2 as detailed in the latest CIRIA (C753) manual. Is the pond proposed to be used for Long Term Storage, confirmation required.

The infiltration basin is not designed to discharge into the existing watercourses/ drainage network. It has been designed as a purely infiltration feature, which does not require a discharge runoff rate from the site. i.e. the Approach method described does not apply in this instance.

8. Freeboard of pond to be demonstrated.

The Source Control calculation within the appendix of the FRA shows the basin to be designed to a depth of 1.5m, with a maximum water depth of 1.2m for the 120 min Winter storm event. Therefore in the 1:100yr plus climate change storm event the demonstrated freeboard is 300mm.

9. Has approval been sought from the LPA under LDA 1991 to discharge to ditchline. If proposal is to discharge to existing ditchlines riparian ownership and maintenance should be demonstrated.

Infiltration is the only form of discharge from the site for storm water; therefore, no surface water will be discharged to existing ditchlines, requiring LDA's.

10. Evidence of Source Control required.

On source control for this site we have a serious of swales and an infiltration basin. Given the varying infiltration on the site it is likely that the swales and the green corridors will also store and infiltrate storm water (for a robust design at this stage obviously the calculations only consider the main basin for such infiltration). If further methods of source control are included in a future detained application like water butts or water harvesting, these may be included then, but could not be defined at this stage.

11. Site should be divided into sub-catchments each dealing with its own surface water requirement. Dispersed site storage and flow control around the site to final pond destination is expected.

This is an infiltration design, there is some semblance of each parcel having such drainage features through the swales on site. This is not a particularly large site and other recent development in and around this proposal have their own drainage regimes so in a sense on a larger scale each phase of the larger area is its own sub catchment.

In addition, when considering an infiltration design the smaller the catchments the less effective an above ground and simple feature such as the basin shown can be. On smaller scales the sensible approach to infiltration becomes engineered solutions such as perforated manholes soakaways or buried crate systems, which are more difficult to maintain and manage.

12. Conveyance routing around site needs to be demonstrated.

The drainage strategy (DR-05 Rev E), located within Appendix B of the FRA, illustrates the proposed locations of swales and pipe network throughout the development. This network will convey surface water from the residential parcels to the infiltration basin located at the north east of the site.

If reference is being made to overland conveyance then at such an outline application as this it is not appropriate to define individual parcel layouts and therefore gardens and road locations to inform a fine grain plan. At this stage we do show however, that the green infrastructure surrounds each parcel and would therefore form the natural breaks and conveyance channels in such events.

13. Water to be kept at or as close to the surface as possible.

No underground storage has been designed to store or discharge storm water from the site, a number of swales have also been proposed to convey surface water from the residential catchments to the basin in the north of the site. A pipe network has been combined with the use of swales to convey surface water in order to maintain a balance of open SuDS usable green space and a sensible gravity fed system. Any stored water is by its very nature stored at the surface while it infiltrates.

14. Pre and Post development (modified flow route) overland surface water flow plan required.

Firstly, there is no intention to change the topography of the land to the point where drainage would not follow the topography of today. Secondly this is an outline application the internal parcel roads and housing layouts that would dictate such flows are simply not known at this stage, but given the first statement in this answer, this should just be a level of detailed to follow in the RM which reflects broadly the flow routes already demonstrated within the FRA.

15. Safe ingress/egress needs to be demonstrated.

A maintenance slope of 1 in 5 has been illustrated on the basin shown on the updated drainage plan (DR-05 Rev F) located in Appendix A of this note.

16. Sacrificial areas in the event of exceedance should be considered.

The drainage strategy (DR- 05 Rev E), located within Appendix B of the FRA illustrates an exceedance route for storm water should the basin depth be exceeded. This is shown by the yellow arrows and the key has been amended in the subsequent revised drawing revision F in Appendix A of this note.

17. Further thought needs to be given to maximising use of green space on site for SuDS incorporation.

SuDS have been incorporated within all the available green space within the site boundary. The green space through the development must perform many planning functions and requirements. Green space that has no SuDS incorporated has been designated to usable green space such as NEAP and LEAP areas and public footpaths. The system within the FRA has therefore been fully considered in the wider context of all planning requirements.

18. Treatment and Management train needs to be demonstrated.

The treatment of surface water is demonstrated within the Water Quality section of Chapter 4 of the FRA. This incorporates paragraphs 4.33 to 4.42 and Figures 4e, 4f and 4g. The management of the proposed SuDS are described in Figure 4h, paragraph 4.46 of the FRA.

19. Use of full toolbox of appropriate SuDS methods to be demonstrated on plan.

The combination of swales and an infiltration basin has been used within the development to convey, store and discharge storm water from the site. This is our proposal for the site. further parcel detail can be sort at detailed or RM applications that follow. 3 forms of treatment are already shown within the submitted plan, being piped, then Swales and finally an infiltration basin.

20. All hardstanding should be of a permeable construction.

This is an outline application and should not be as descriptive at this time. A detailed application or RM may well propose a range of measures within the parcel design for the eventual scheme and therefore should not be as prescriptive at this stage.

It should be noted that the design that is shown already demonstrates a robust and sustainable approach to drainage for the development

21. Blue/Green roofs and rainwater harvesting should be considered.

This is an outline application and as discussed above this level of detail is not known. A detailed application or RM may well propose a range of measures within the parcel design for the eventual scheme and therefore it should not be as prescriptive at this stage.

Again, it should be noted that the design that is shown already demonstrates a robust and sustainable approach to drainage for the development

22. Confirmation required for half drain down times, for example the attenuation pond.

The half drain down time of the critical 1:100 yr event in the infiltration basin is 185 minutes. This is shown within the Source Control calculations within Appendix B of the FRA.

23. Justification as to whether 10% Urban Creep allowance has been applied required.

10% urban creep has been taken into consideration, this can be seen in Figure 4d, paragraph 4.27 of the FRA.

24. Management and Maintenance plan to be worked up (in draft at this stage) and submitted.

The treatment and management of the proposed SuDS are described in Figure 4h, paragraph 4.46 of the FRA. The type of SuDS is shown on the main drainage plan and therefore read together form the proposed management and maintenance regime. If the question is who will do the work then currently it is assumed that the Maintenance would be undertaken by a management company, a typical solution across the country. We are aware of Water Companies potentially now taking into adoption SuDS since legislation change in April of this year, however the pace at which they are moving on this at present, means it is currently still prudent to assume maintenance of such features remains a private matter.

## **3 OCC Drainage Response Email contents 12<sup>th</sup> May 2020**

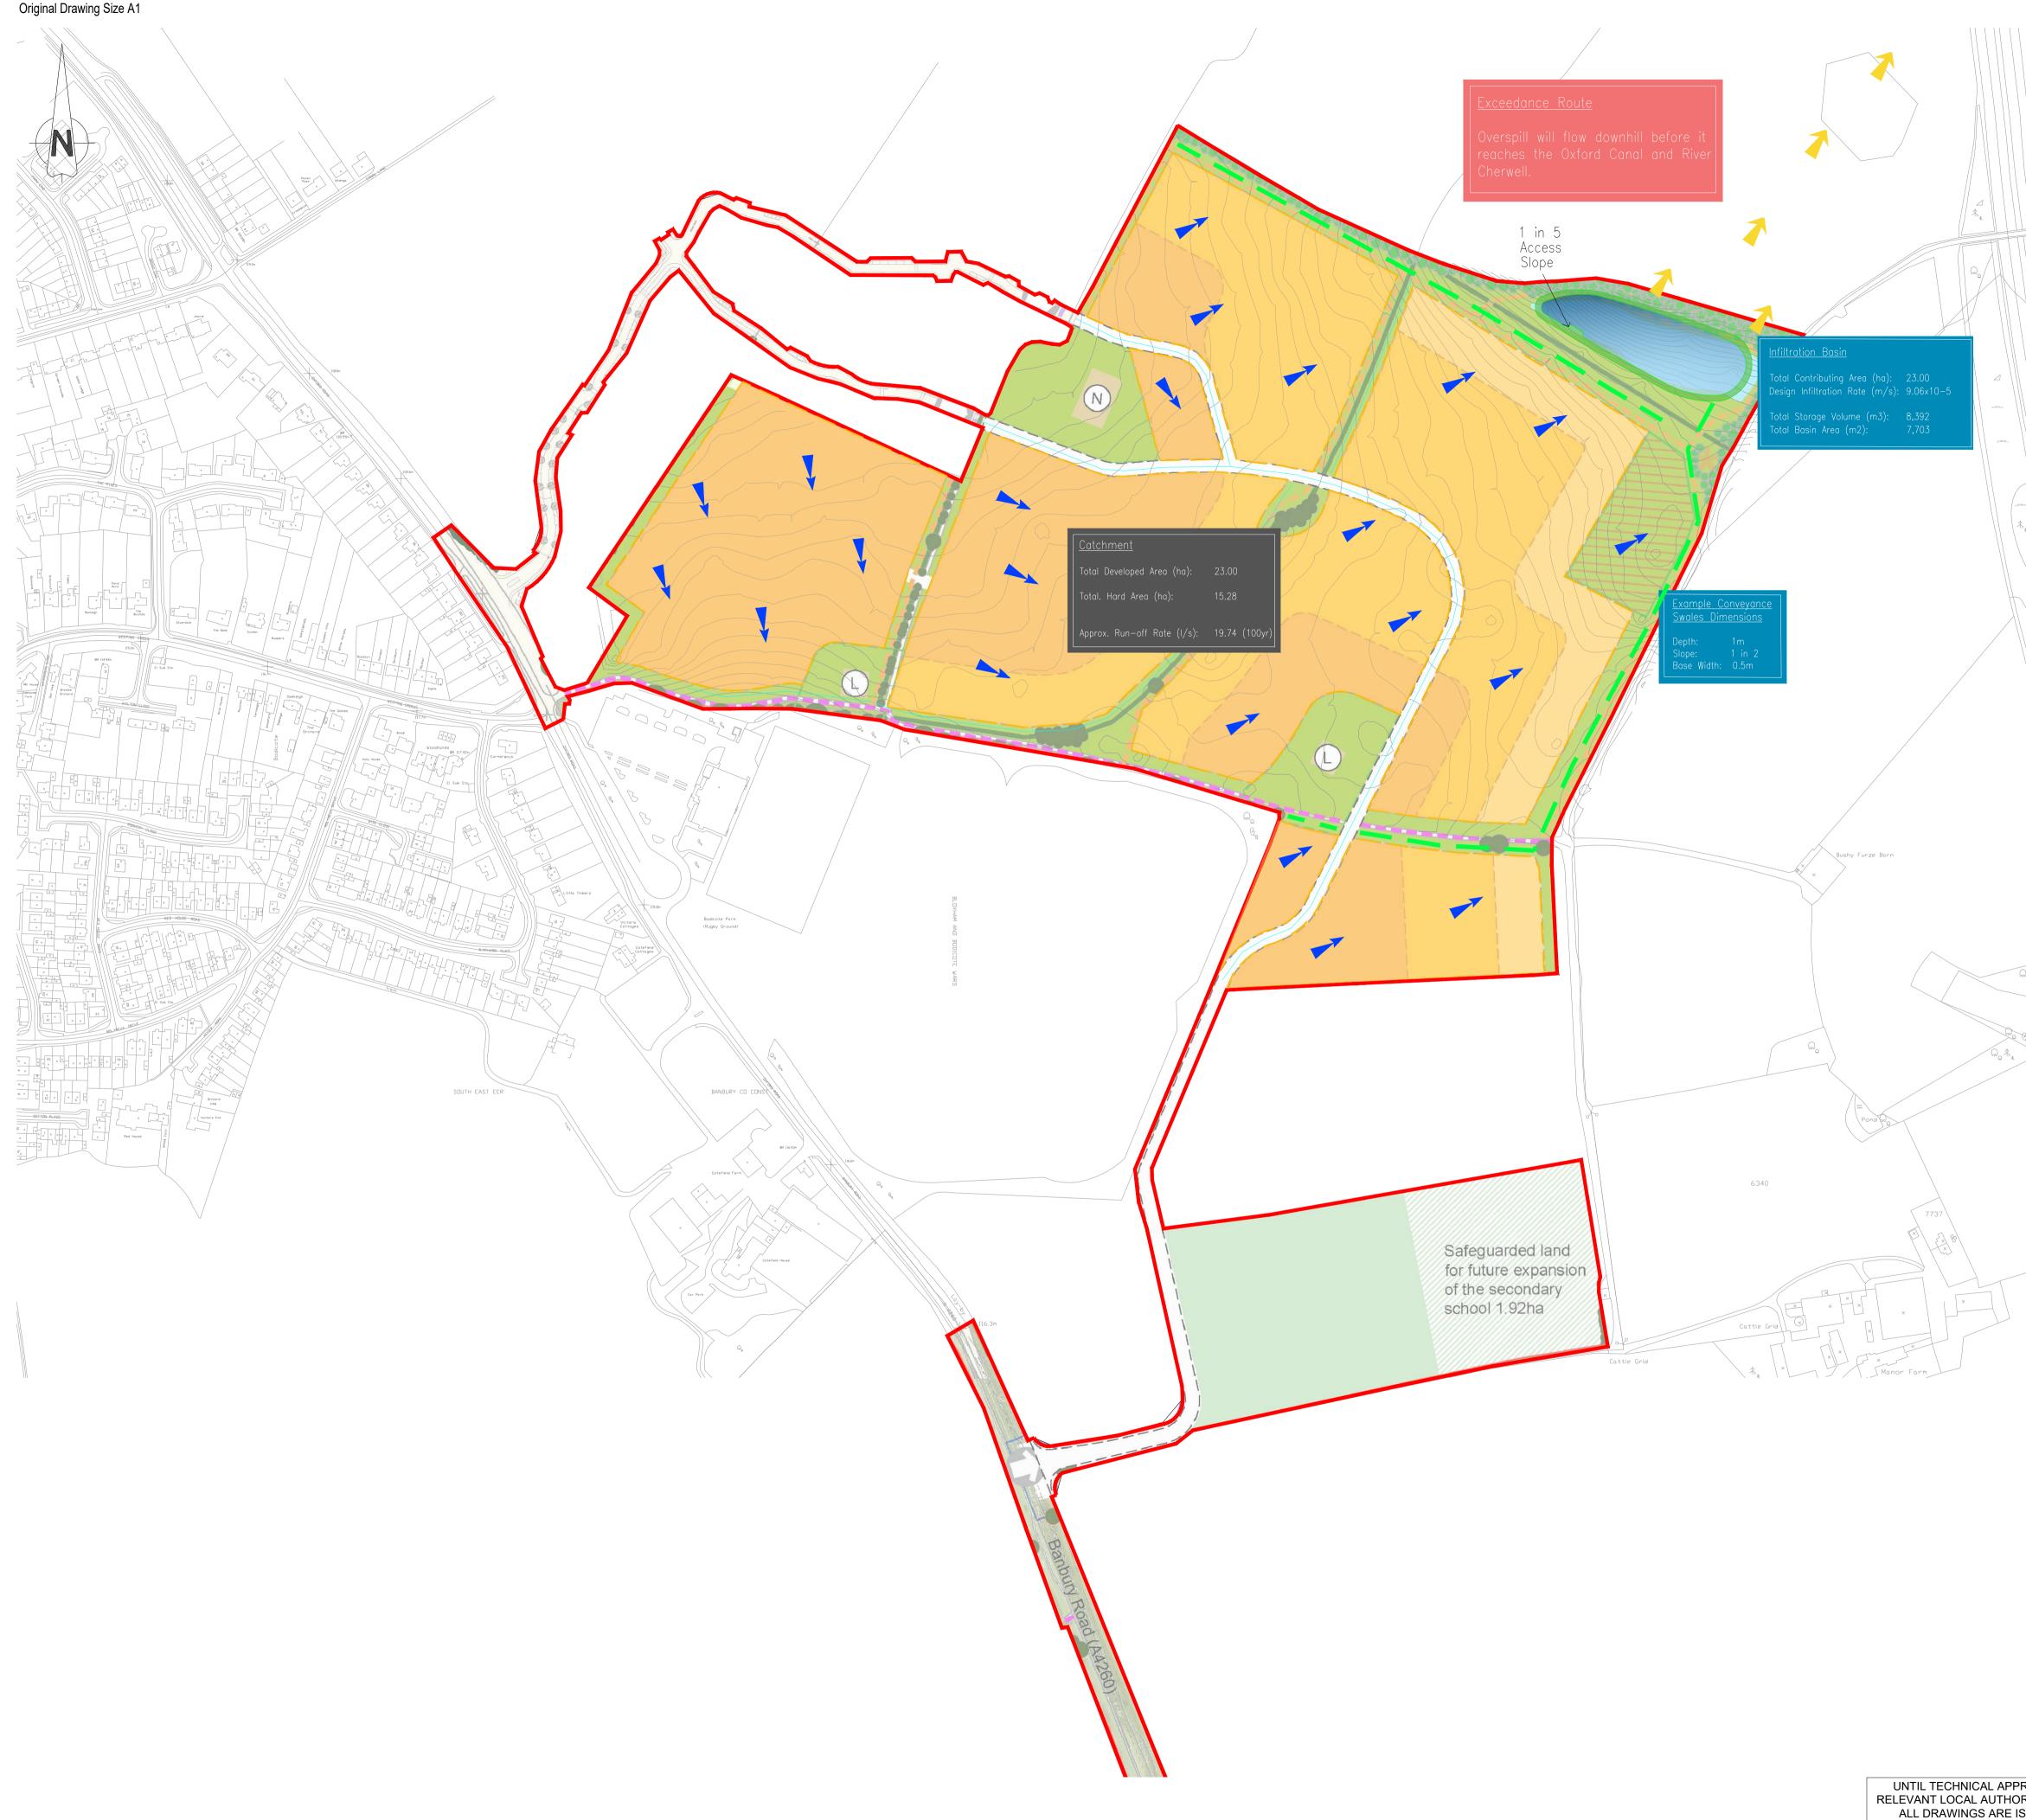

A. I will accept the calculations Cv value but request FEH is confirmed as having been used.

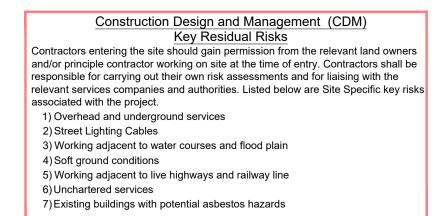

FEH has been used and the revised calculations are within Appendix B of this Technical Note. It should also be noted that the updated Drainage plan within Appendix A has been amended to account for FEH rainfall calculations.

B. Please could you also complete the attached pro-forma as this will greatly speed up the technical assessment side of the calculations.

Pro-Forma is completed and is within Appendix C of this Technical Note.

Appendix A

## NOTES:

- 1. Do not scale from this drawing
- 2. All dimensions are in metres unless otherwise stated.
- 3. Brookbanks Consulting Ltd has prepared this drawing for the sole use of the client. The drawing may not be relied upon by any other party without the express agreement of the client and Brookbanks Consulting Ltd. Where any data supplied by the client or from other sources has been used, it has been assumed that the information is correct. No responsibility can be accepted by Brookbanks Consulting Ltd for inaccuracies in the data supplied by any other party. The drawing has been produced based on the assumption that all relevant information has been supplied by those bodies from whom it was requested.

## SuDS Flows and Volumes - LLFA Technical Assessment Pro-forma

This form identifies the information required by Oxfordshire County Council LLFA to enable technical assessment of flows and volumes determined as part of drainage I SuDS calculations.

Note : \* means delete as appropriate; Numbers in brackets refer to accompanying notes.

### SITE DETAILS

- 1.1 Planning application reference: 19/01047/OUT-2
- 1.2 Site name: Bankside, Banbury
- 1.3 Total application site area (1 400,000 m<sup>2</sup> ......•... .40 .ha
- 1.4 Is the site located in a CDA or LFRZ N
- 1.5 Is the site located in a SPZ N

### **VOLUME AND FLOW DESIGN INPUTS**

- 2.1 Site area which is positively drained by SuDS ( $|^2$  230,000 m<sup>2</sup>
- 2.2 Impermeable area drained pre development ( $\beta$  0 m<sup>2</sup>
- 2.3 Impermeable area drained post development (3 152,800 m<sup>2</sup>
- 2.5 Predevelopment use (4 Greenfield
- 2.6 Method of discharge (<sup>5</sup> Infiltration
- 2.7 Infiltration rate (where applicable) 0.326 m/hr
- 2.8 Influencing factors on infiltration
- 2.9 Depth to highest known ground watertable No Groundwater encountered to 2m depth mAOD
- 2.10 Coefficient of runoff (Cv) (6 0.925
- 2.11 Justification for Cv used Between 0.9 and 0.95 as agreed
- 2.12 FEH rainfall data used (Note that FSR is no longer the preferred rainfall calculation method) Y
- 2.13 Will storage be subject to surcharge by elevated water levels in watercourse/ sewer N
- 2.14 Invert level at outlet (invert level of final flow control) N/A mAOD
- 2.15 Design level used for surcharge water level at point of discharge (141. N/A mAOD

#### Revision1.4-IssuedJuly2019

## SuDS Flows and Volumes - LLFA Technical Assessment Pro-forma

## **CALCULATION OUTPUTS**

Sections 3 and 4 refer to site where storage is provided by attenuation and I or partial infiltration. Where all flows are infiltrated to ground omit Sections 3-5 and complete Section 6.

3.0	Defining rate of runoff from the sit	te
3.2	Max.discharge for 1 in 1 year rainfall	I/s/ha,I/s for the site
3.2	Max.discharge for Qmed rainfall	I/s/ha,I/s for the site
3.3	Max.dischargefor1in30yearrainfall	I/s/ha,I/s for the site
3.4	Max. discharge for 1 in 100 year rair	nfallI/s/ha,I/s for the site
3.5	Max.dischargefor1in100yearplus40	0%CCI/s/ha,I/s for the site
4.0	Attenuation storage to manage pe	ak runoff rates from the site
4.1	Storage - 1 in 1 year	m <sup>3</sup> m <sup>3</sup> /m <sup>2</sup> (of developed impermeable area)
4.2	Storage -1in 30 year (7	
4.3	Storage -1in 100 year (8)	m <sup>3</sup> m3/m2
4.4	Storage - 1 in 100 year plus 40%CC $_{(9)}$	m3m3/m2
5.0	Controlling volume of runoff from	the site
5.1	Pre development runoff volume(b	m <sup>3</sup> for the site
5.2	Post development runoff volume (unmitig	gated) (b
5.3	Volume to be controlled/does not leave	ve site (5.2-5.1) m <sup>3</sup> for the site
5.4	Volume control provided by Interception losses(11) Rain harvesting(12) Infiltration (even at very low rates) Separate area designated as long term s	m3 m3 m3 torage( <sup>13</sup> )m3
5.5	Total volume control (sum of inputs f	for 5.4)m3 (15)

6.1	Storage - 1in 30 year (7	3,586.5 m <sup>3</sup> 0.023 m <sup>3</sup> /m <sup>2</sup> (of developed impermeable area)
6.2	Storage - 1 in 100 year plus CC (?	8391.9 m3 0.055 m3/m2

Revision1.4-IssuedJuly2019

## SuDS Flows and Volumes - LLFA Technical Assessment Pro-forma

### Notes

- 1. All area with the proposed application site boundary to be included.
- The site area which is positively drained includes all green areas which drain to the SuDS system and area of surface SuDS features. It excludes large open green spaces which do not drain to the SuDS system.
- 3. Impermeable area should be measured pre and post development. Impermeable surfaces includes, roofs, pavements, driveways and paths where runoff is conveyed to the drainage system.
- 4. Predevelopment use may impact on the allowable discharge rate. The LLFA will seek for reduction in flow rates to GF status in all instances. The design statement and drawings explain/ demonstrate how flows will be managed from the site.
- 5. Runoff may be discharge via one or a number of means.
- 6. Sewers for Adoption 6<sup>th</sup> Edition recommends a Cv of 100% when designing drainage for impermeable area (assumes no loss of runoff from impermeable surfaces) and 0% for permeable areas. Where lower Cv's are used the application should justify the selection of Cv.
- 7. Storage for the 1 in 30 year must be fully contained within the SuDS components. Note that standing water within SuDS components such as ponds, basins and swales is not classified as flooding. Storage should be calculated for the critical duration rainfall event.
- 8. Runoff generated from rainfall events up to the 1 in 100 year will not be allowed to leave the site in an uncontrolled way. Temporary flooding of specified areas to shallow depths (150-300mm) may be permitted in agreement with the LLFA.
- 9. Climate change is specified as 40% increase to rainfall intensity, unless otherwise agreed with the LLFA / EA.
- 10. To be determined using the 100 year return period 6 hour duration rainfall event.
- 11. Where Source Control is provided Interception losses will occur. An allowance of <u>5mm rainfall depth</u> can be subtracted from the net inflow to the storage calculation where interception losses are demonstrated. The Applicant should demonstrate use of subcatchments and source control techniques.
- 12. Please refer to Rain harvesting BS for guidance on available storage.
- 13. Flow diverted to Long term storage areas should be infiltrated to the ground, or where this is not possible, discharged to the receiving water at slow flow rates (maximum 2 l/s/ha). LT storage would not be allowed to empty directly back into attenuation storage and would be expected to drain away over 5-10 days. Typically LT storage may be provided on multi-functional open space or sacrificial car parking areas.
- 14. Careful consideration should be used for calculations where flow control/storage is likely to be influenced by surcharged sewer or peak levels within a watercourse. Storm sewers are designed for pipe full capacity for 1 in 1 to 1 in 5 year return period. Beyond this, the pipe network will usually be in conditions of surcharge. Where information cannot be gathered from Thames Water, engineering judgement should be used to evaluate potential impact (using sensitivity analysis for example).
- 15. In controlling the volume of runoff the total volume from mitigation measures should be greater than or equal to the additional volume generated.
